

Project Outline: Application Access Troubleshooting - Browser & Cookie Management

Project Title: Application Access Troubleshooting: PeopleSoft Cookie Management & Escalation

1. The Problem:

* **User Reported Issue:** A user was unable to access PeopleSoft, encountering an error message indicating that "cookies were being managed by the organization." This prevented them from logging into a critical enterprise application.

2. Your Diagnosis & Action:

* **Initial Hypothesis:** My initial assessment, based on the error message, pointed directly to browser cookie settings. I hypothesized that either cookies were blocked, or specific settings were preventing PeopleSoft from setting/reading necessary cookies for authentication.

* **Remote User Guidance:** I attempted to troubleshoot the issue remotely with the user over the phone. Recognizing that the user was not particularly tech-savvy, I provided clear, step-by-step instructions on how to navigate to their internet browser's settings (e.g., Chrome, Edge, Firefox - depending on what was in use).

* Troubleshooting Steps Attempted:

* Guided the user to the browser's privacy and security settings.

* Instructed them on how to locate cookie management options.

* Attempted to help them identify and adjust settings related to allowing third-party cookies or adding PeopleSoft's URL as an exception, based on common cookie-related access issues.

* **Roadblock Encountered:** Despite my guidance, we encountered a "third-party issue" or a configuration that was preventing the necessary cookie adjustments. This indicated a more complex browser policy, group policy, or enterprise-level management of browser settings that was beyond standard user-level adjustments or my intern-level access/tools.

* **Decision to Escalate:** Given the complex nature of the cookie management (likely controlled by organizational IT policies) and the user's difficulty in navigating the advanced settings, I determined that the issue required higher-level administrative insight.

* **Action Taken:** I informed the user that the issue required further investigation by a specialist and escalated the case to a Senior Colleague. I provided a clear summary of the symptoms, the troubleshooting steps I had already attempted, and the specific roadblock encountered (the "third-party issue" preventing cookie modification).

3. The Solution (by Senior Colleague):

* **Resolution Pathway:** The Senior Colleague would then leverage their higher permissions and specialized knowledge of organizational browser policies (e.g., Group Policy Objects, MDM settings) to investigate and resolve the core issue causing the cookie management conflict with PeopleSoft. This could involve adjusting enterprise browser policies or providing a specific workaround.

4. Outcome & Impact:

- * Problem Resolution (indirect): While I did not directly resolve the issue due to scope limitations, my initial troubleshooting and effective escalation ensured the problem was accurately identified and passed to the appropriate expert.
- * Effective User Support: I provided patient and clear guidance to a non-tech-savvy user, helping them navigate complex settings, which is a valuable soft skill in IT support.
- * Learning Experience: This incident deepened my understanding of how organizational policies (like cookie management via Group Policy) can impact application access, and when to recognize a problem that requires higher-tier intervention.

5. Skills Demonstrated:

- * Remote Troubleshooting: Guiding a user through technical steps without direct physical access.
- * User Guidance & Empathy: Patiently assisting a non-tech-savvy individual through complex browser settings.
- * Application-Specific Troubleshooting: Understanding how browser settings (cookies) impact enterprise applications like PeopleSoft.
- * Problem Isolation: Identifying the specific roadblock (the "third-party issue" preventing cookie modification).
- * Effective Escalation: Clearly documenting troubleshooting steps and handing off to a senior colleague with necessary information.
- * Browser Configuration Knowledge: Familiarity with browser settings related to privacy and cookies.
